☞ This data is recommended for 3xDia. And should be reduced about 15~20% for 5xD, 7xD, 10xD drills.

☞ The data is normally suggested for oil-mist(MQL) coolant condition and also possible to run in other normal condition if machining environment like clamping etc. are secured in good.

Indexable, Coolant Drill Series

☞ This data is recommended for 3xDia. And should be reduced about 15~20% for 5xD, 7xD, 10xD drills.

☞ The data is normally suggested for oil-mist(MQL) coolant condition and also possible to run in other normal condition if machining environment like clamping etc. are secured in good.

# KRUZ "K" series drill body & insert

## Caution !!!

"K" series inserts (IDFK or IDPK) should use only with "K" series body (KRUZ-SLK or FSLK) to avoid drilling failure.

### IDFK Carbide insert

- Carbide insert completely grinded by CNC program
- Patented 140°+170° dual angle flat bottom point
- TiAlN coated insert offers wear resistance and higher feed rate
- Designed exclusively for structural beam, angle or single plate drilling

### IDPK Carbide insert

- Carbide insert completely grinded by CNC program
- Patented 130°+150° dual point angle
- TiAlN coated insert offers wear resistance and higher feed rate
- Appropriate insert design for stack plates drilling

(for stacked plates)

### KRUZ-SLK Drill body

- Rigid drill body made of special premium steel and heat treated
- TiN coated body to enable longer tool life and higher lubricity
- Special flute design to increase faster chip's ejection rate
- Enabling to mount 0.5mm inclusive both IDFK & IDPK inserts
- Stubby length to perform maximum drilling ability of structural machining
- Internal coolant fed

# **KRUZ-FSLK Flanged body (5xD), IDFK & IDPK insert**

**KRUZ-FSLK**

**IDFK** for beam, angle, single plate

**IDPK** for stacked plate

- ▶ When requires longer drill length, select this ideal drill body
- ▶ Drilling closer to flange part
- ▶ Minimized flute design with longer cylindrical neck
- ▶ Increased drill's rigidity than ordinary 5xDia drill length
- ▶ Internal coolant fed design
- ▶ Flanged shank to reduce chattering or vibrating

# Technical tip for structural steel machining

Note that structural steel can not be clamped easily due to too big and longer work-piece shape than industrial smaller component parts. When the drilling spindle feed down toward the structural, the part will have a tendency of bending, deformation, chattering or vibrating that is not visible. In order to achieve better drilling, we suggest you to consider following technical points.

- ☞ Don't use excessive longer length to maximize performance. Select a drill as shorter length as it is available to avoid vibrating or chattering trouble.
- ☞ Structural steel is generally less than 50mm thickness only. YESTOOL's KRUZ-SLK drill is properly designed with stubby length enough to run majority of structural steel.
- ☞ In case running with unnecessary longer drill like HSS MT shank length, it will be badly influenced on chattering, vibrating, distorted or oversize hole trouble etc. Of course, tool life could be decreased by above reasons.
- ☞ If you would like to use longer drill inevitably by interruption of flange height, recommend to select KRUZ-FSLK neck extended drill body that is designed to reduce chattering or vibrating trouble than conventional drill.
- ☞ If ISO holder and KRUZ-SLK drill length is insufficient, use Extension socket that can be compensated for shorter length.
- ☞ Reduction sleeve also helps to run current holder without new holder change. This sleeve can be used for reducing shank diameter if inner holder size is bigger than drill shank.
- ☞ The cutting parameter table is shown for recommendation only. Machine operator should find certain optimum value where runs smoothly without vibrating.
- ☞ Plate machining is to apply with different insert. (See the photos on right.)

1. Input<Tool Length>before drilling.(Tool length=Holder length+Drill length)  
 2. Input cutting condition from step 1 to step 6 in consideration of productivity or stability.  
 3. Use previous step condition if you find a vibration or unstable result at faster step.  
 4. If you use other size of drill, please ask us about cutting condition via E-mail "yestool@yestool.co.kr"

# Speed formula, Drilling of stacked plate, Chip formation

## Major Cutting speed formula

### Cutting Speed

$$V = \frac{\pi \times D \times N}{1000} \text{ (m/min)}$$

- V : Cutting speed (m/min)
- D : Drill diameter (mm)
- N : Revolution per minute (rpm)
- $\pi$  : Circular constant (3.14)

### Feed

$$f = \frac{F}{N} \text{ (mm/rev)}$$

- f : Feed rate (mm/rev)
- F : Depth of cut per minute (mm/min)
- N : Revolution per minute (rpm)

## Recommended application for stacked plate by Yes Carbide Drills

One operation is possible subject to closely tightend stacked plate without any room.

"Woodpecker" method recommended in case of certain aperture in the stacked plate.

## Good chip formation

(initial drilling)

(drilling through)

(bottoming)

(long Stringy chip)

## How to find maximum wear

1. When long and stringy chip formation without broken chip, require to change new tool or regrinding
2. Below pictures show the time of regrinding

Need to change new tool or regrinding

## Power requirement for YES Carbide Drills

$$\text{Power(P)} = \frac{D \times f \times V \times k_s}{24,480 \times 0.7} \text{ (kw)}$$

ex)

$$\text{Power(P)} = \frac{11.5 \times 0.2 \times 60 \times 230}{24,480 \times 0.7} = 1.852 \text{kw}$$

- D = drill diameter (mm)
- f = feed (mm/rev)
- V = cutting speed (m/min)
- ks = specific cutting force (kg/mm)
- η = constants of performance(0.7~0.85)

# Resharpener Guide for YES Carbide Drills

Yes brand Carbide drill can be resharpened by CNC 5 axis machine or Universal tool grinder with our own special attachment. The below procedure is to regrind by Universal tool grinder, while follow "S" point program in case of CNC machine.

## Removal of worn section

Remove all of the worn or chipped section before regrinding.

## Regrinding drill point

1. Put the drill point horizontally on the stopper.(see 1.1)
2. Set dial gauge on <a> and turn the drill to coincide central line of point. Then, tighten the collect chuck securely.(see 1.2)

3. Set the cutting edge toward grinding wheel to the point angle <c1, 8°> as shown (1.3). Then, keep the angle <c2, 20°> as shown (1.4).
4. Grind the flank up and down repeatedly as shown <b1>.

5. Move forward the grinding wheel and grind the cutting lips, after keeping the attachment horizontally.
6. Rotate the attachment at 180° toward <c3> and grind other cutting edge by the same procedure as NO.4, 5.(see 1.5) Make sure that both cutting lips should be equal or symmetrical.

## Web thinning

1. Set the drill at 30° or 35° in the drill attachment.(see 2.1) (In case of drill for AL, FC material, keep 30°, while others at 35°.)
2. Align the "B" face of wheel at center line of drill.(see 2.2)
3. Set the "B" face of wheel at 45° from central line of the drill.

4. Grind as procedure <cut 1>,<cut 2>, <cut3>.(see 2.3)
5. Rotate the attachment at 180° and grind other facet by NO.4 procedure. Note that the shape of the thinning should be such that it does not interfere with chip flow.

**Note**  
If you have any difficulty to regrind in your shop, you may use our factory expert service which is being serviced at reasonable cost in one week returning delivery Contact ours.
