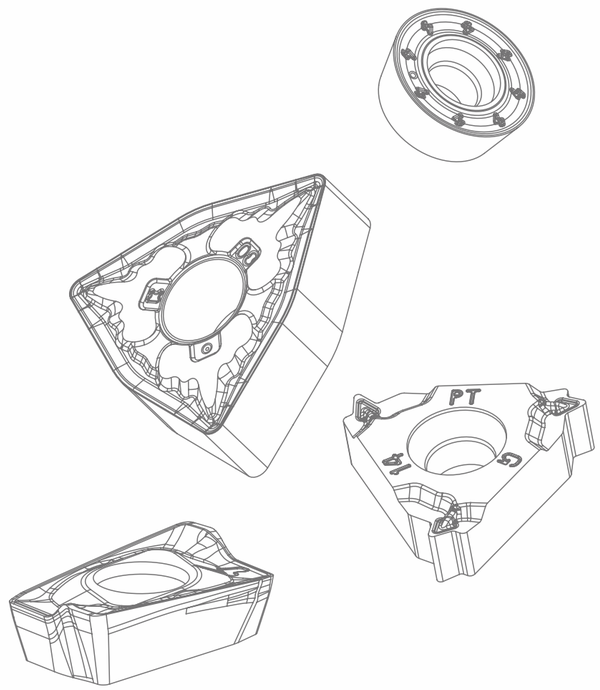
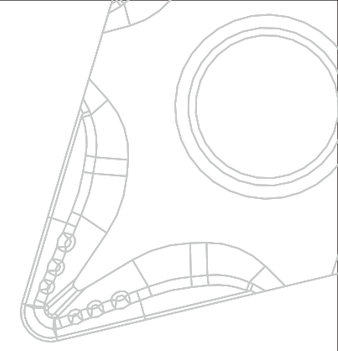
CUTTING TOOLS CATALOG





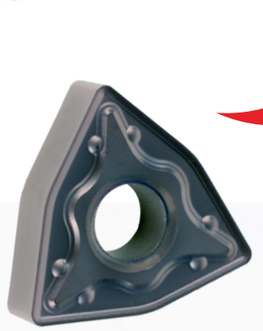
Cutting Tools

OKE 欧科亿

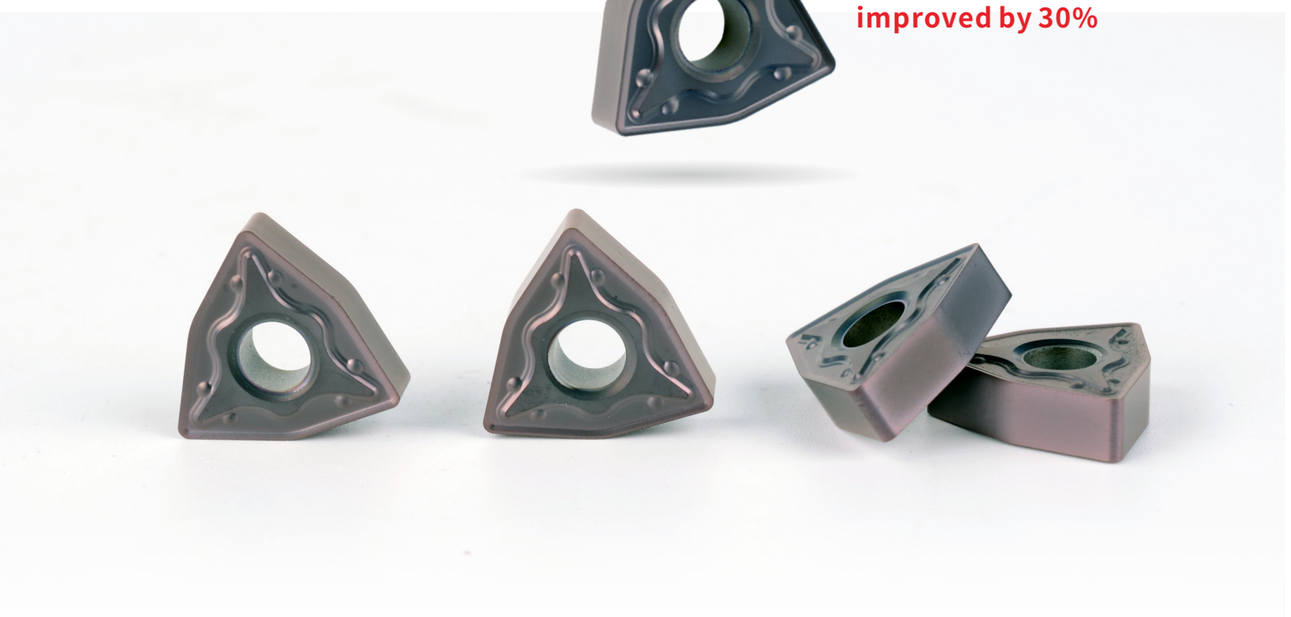
PVD stainless steel new grade for turning machining

OP1415

NEW



Performance is improved by 30%

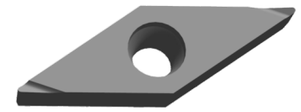


Cutting Tools for Small Parts Machining

NEW

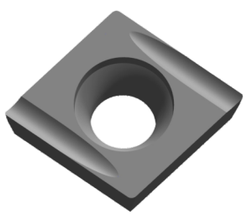
Front sweep tool

Precision small parts processing
4 types of cutting tools (front sweep, back sweep, cutting, grooving);
Stable product performance, used for automatic processing



JF chipbreaker

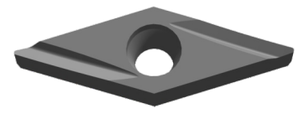
Better chip handling capacity, suitable for small cutting depth, large feed processing conditions
Excellent cutting effect to obtain good workpiece surface quality



JU chipbreaker

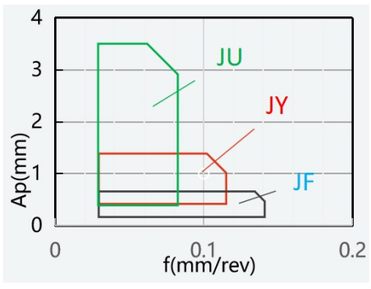
Sharp cutting edge， small resistance， can be used for slender shaft processing
Long cutting edge, the maximum cutting depth is 4mm, high processing efficiency, can meet the demand of "one size fits all"

JY chipbreaker



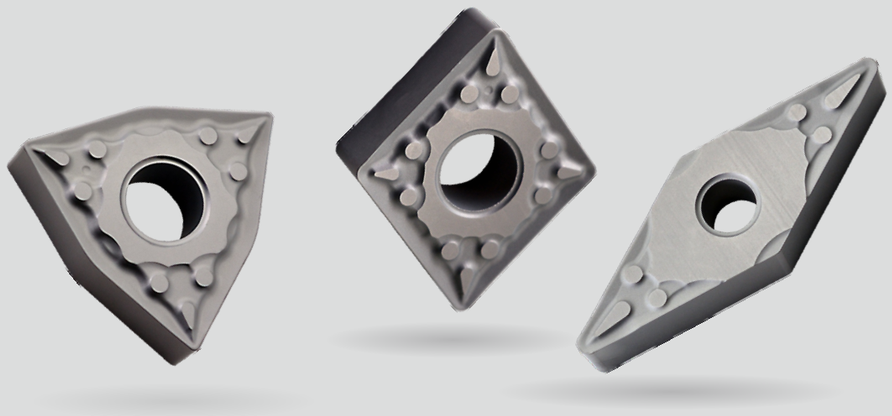
Wide chipbreaker can ensure smooth cutting
Excellent chip handling capability can improve tool life and chip performance

Recommended machining parameter



OKE 欧科亿

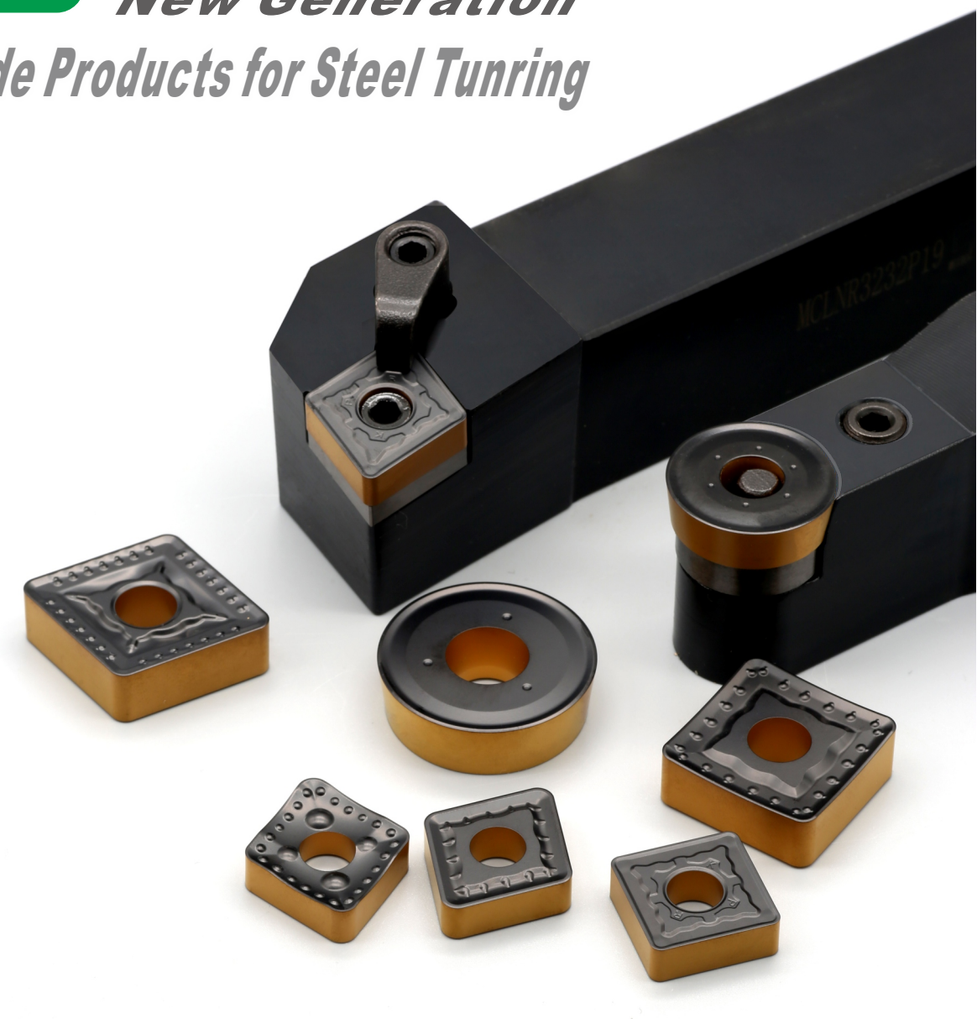
Cermet turning grade
OKE6310



OKE 欧科亿

Efficient•Stable **New Generation**

CVD grade Products for Steel Tunring



Steel

Finishing

-OPF

Special designed for steel finishing;
Unique design efficiently controls the form of chip and breaks chip;
Sharp cutting edge, smooth cutting;
Excellent surface quality.

-OTF

Special chip breaker structure makes excellent chip breaking even at small cutting depth.
Sharp cutting edge,cutting smoothly and quickly.

Semi-Finishing

-OPM

Negative chamfer designation gives blade good strength;
Double chipbreaker lands, makes bigger chip control range.

-OTM

Flat cutting edge design,good wear-resistance and breakage resistance.
Inclination angle combination structure can control the chip breaking direction efficiently.

Roughing

-OPR

Three-dimension designed with double rake angle, wide margin and negative chamfer;
Wonderful blade intensity gives a longer tool life time;
Suitable for steel roughing machining.

-OTR

Flat cutting edge with big rake angle,gives good wear-resistance.
Varying chip breaker depth design,good performance on chip breaking control.

Stainless Steel

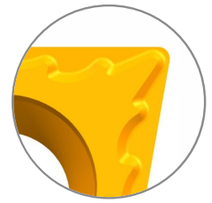
Finishing

-OMF

Special designed rake angle and cutting edge inclination;
Sharp cutting edge, small cutting force;
Good machining surface quality.

-MSF

Three-dimension designed with double rake angle;
Sharp cutting edge and lower cutting resistance;
Efficiently solved build up edge, work hardening and other machining problems.
Cutting edge inclination designation is good to control chip flow direction and obtains excellent Surface quality.



-OTF

Special chip breaker structure makes excellent chip breaking even at small cutting depth.
Sharp cutting edge,cutting smoothly and quickly.

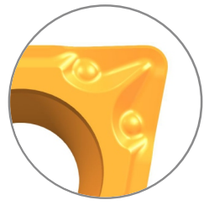
Semi-Finishing

-OMM

Special chipbreaker design to keep cutting edge sharp and safe;
Good anti impact resistance;
Excellent tool life time;

-MF

Special chipbreaker design to keep both sharp cutting edge and increased blade intensity;
Efficiently solved break chip, high cutting temperature, sticking, work hardening and other machining problems.
It has very excellent effiiciency



-OTM

Flat cutting edge design,good wear-resistance and breakage resistance.
Inclination angle combination structure can control the chip breaking direction efficiently.

Cast Iron

Finishing To Semi-Finishing

-OKM

Wide support surface for stable clamping and preventing chipping

Sharp cutting edge, improve workpiece surface quality
Excellent chipping resistance in continuous machining
High quality surface roughness

Roughing

-OKR

Wide support surface for stable clamping and preventing chipping

Optimized edge width for high-speed, high-feed machining
Excellent chipping resistance in interrupted machining
Improve machining stability and extend tool life

High Temperature Alloy

Semi-Finishing

-SMM

Three-dimensional groove design with large rake angle;

Sharp cutting edge and low cutting force;

Processing difficulties such as high temperature processing and work hardening;

Suitable for finishing of super-alloy materials.

-OSM

Effectively control chip curling and flow;

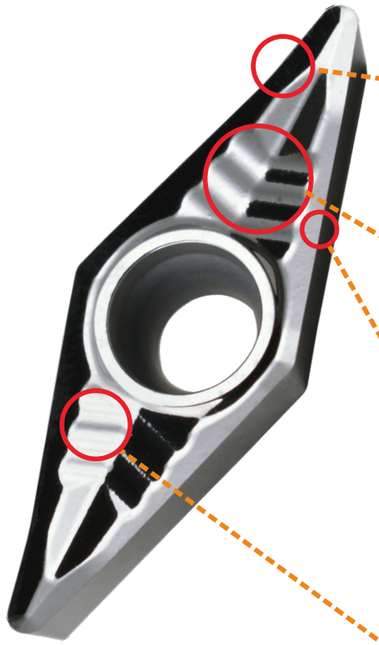
Sharp cutting edge, smooth quick cutting;

Proper edge strength gives a longer service life

Aluminum Alloy

–NL

Finishing To Roughing

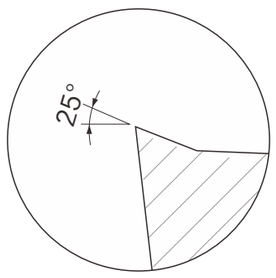


Large rake angle and clearance angle form sharper cutting edge, it's optimized quick cutting and lower cutting loading;

Unique 3D chip breaker and sufficient chip pocket design;

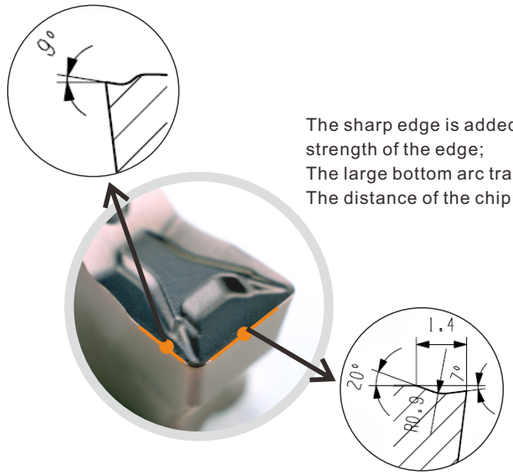
Special design in cutting edge inclination efficiently controls chipping flow direction.

Mirror effect on rake face obtains good surface quality and long insert life.



Parting and Grooving

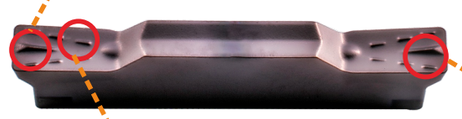
–OC



The sharp edge is added with a 7-degree rake angle to ensure the sharpness and strength of the edge;
The large bottom arc transition ensures the smooth curling of the chips;
The distance of the chip breaker effectively ensures the breaking of the chips.

–MG

Convex design on the top reduces the chip width,it has a better effect on the chip curling and chip breaking.



For turning and grooving

Small convex design on the sides contributes well to chip breaking in turning process.

CVD

Grade	Hardness	Coating Type	Colour	Feature
OC2115	1530	CVD	Black	Low Cobalt content, and high cubic content carbide substrate combine with thick TiCN and Al_2O_3, treated by special after coating treatment, which gives insert wonderful wearing resistance. Preferred grade for semifinishing to finishing steel machining. ●
OC2125	1480	CVD	Black	Low Cobalt content, and high cubic content carbide substrate combine with thick TiCN and Al_2O_3, treated by special after coating treatment, which gives insert wonderful wearing resistance. Preferred grade for semifinishing to finishing steel machining. ●
OC2325	1480	CVD	Yellow	Medium cobalt content, and high cubic content carbide substrate combine with strong texture TiCN and Al_2O_3 coating. After special treatment, it has wonderful abrasion resistance. ●
OC2325S	1480	CVD	Double color	Gradient hard alloy substrate with rich cubic phase content has better high temperature performance and plastic deformation resistance. The uniform dense and fine-grained coating has excellent wear resistance, and the special transition layer structure ensures the anti-peeling performance of the coating; The unique post-processing technology realizes a two-color marking layer and uniform compressive stress distribution, ensuring higher wear resistance and stability. It is suitable for turning of various steels and is the first choice for wear resistance. ●

CVD

Grade	Hardness	Coating Type	Colour	Feature
OC2425	1470	CVD	Double color	High cubic content gradient carbide substrate, gives good anti-deformation resistance and excellent high temperature performance. Dense and uniform ultra-fine-grained coating, providing excellent wear resistance, unique transition layer structure, to ensure the anti-peeling performance of the coating; unique post-processing technology, realizing two-color and beneficial compressive stress distribution, to achieve higher resistance Abrasiveness and stability. The substrate edge part adopts a unique "skeleton" structure, which achieves excellent cutting performance and good safety. The red hardness of the substrate is further improved by optimizing and adjusting the ratio of raw materials in the solid solution and the particle size of the raw materials. It is suitable for high-efficiency, light-interrupted machining of P10-P20 (medium and high carbon steel, low alloy steel), with a wider application range and better stability. ●
OC3210	1650	CVD	Double color	Fine-grained and high-hardened chemical coating, the substrate has good wear resistance, and achieves stability and long life in a wide range of processing fields. Gray cast iron, ductile iron machining (continuous, light interrupted conditions) Gray cast iron, ductile iron machining (small parts roughing) ●
OC3215	1580	CVD	Black	The medium-coarse substrate combine with thick TiCN and textured Al_2O_3, after special after coating treatment,it has outstanding wearing resistance. Suibtable for high speed semi-finihsing cast iron cutting under stable work condition. ●
OC3220	1600	CVD	Double color	MTCVD TiCN-Al_2O_3 coating strengthened by fine-grained α-Al2O3 film, the substrate is a kind of hard alloy with good toughness Gray cast iron, ductile iron machining (strong interrupted conditions) Gray cast iron, ductile iron machining (roughing, black skin conditions) ●
OC4315	1480	CVD	Gold	Medium Cobalt content, and high cubic content carbide substrate combine with thin TiCN and Al_2O_3, treated by special after coating treatment, which gives insert wonderful wearing resistance. Preferred grade for stainless steel turning at high speed. ●

PVD

Grade	Hardness	Coating Type	Colour	Feature
OP1030	1500	PVD	Gray	High Co content and ultra fine WC grain substrate, gives wonderful toughness, combines with PVD AlTiN coating, it has good strength and versatility. Suitable for steel and stainless steel milling and drilling. ● ●
OP1205	1650	PVD	Dark Purple	High Co content and ultra fine WC grain substrate, gives wonderful cutting edge strength, combines with good thermal stability silicon coating, it has very small coefficient of friction, and good nano hardness. Suitable for steel and stainless steel continue turning and threading. ● ●
OP1215	1560	PVD	Dark Purple	High Co content and fine WC grain substrate, gives wonderful cutting edge strength, combines with good thermal stability silicon coating, it has very small coefficient of friction, and good nano hardness. Good at stianless steel semi−finishing turning , parting and grooving processing.preferred grade for steel and stainless steel milling and drilling. ● ●
OP1315	1560	PVD	Gray	High Co content and fine WC grain substrate, gives wonderful cutting edge strength, combines with new AlTiN coating, it has very small coefficient of friction,high antioxidant temperature, and good nano hardness. Preferred grade for steel and stainless steel milling and drilling. ● ●

Grade	Hardness	Coating Type	Colour	Feature
OP1415	1550	PVD	Dark Purple	The coating has dense columnar crystals and small gaps between crystals, which can effectively improve the oxidation resistance and plastic deformation resistance; The lower the roughness of the coating surface, the lower the resistance and heat generated during cutting can be effectively reduced; The bonding force between the film layer and the substrate is strong, which reduces the abnormal cracking of the product and improves the service life of the tool. ●
OP1325	1580	PVD	Yellow	New material substrate has good anti wear resistance and anti impact resistance. Combining with multiple layers AlTiN coating, it has excellent adhesion between coating and substrate which improves tool life significantly. Suitable for general steel, and stainless steel milling. ● ●
OP1630	1520	PVD	Yellow	Newly upgraded coating technology, the new king of steel milling; Enhanced tip design, excellent impact resistance; Improved side, stable fit; With supporting development of steel products, the performance is better; ●
OP2202	1640	PVD	Gray	High Co content and ultra fine WC grain substrate, gives wonderful cutting edge strength, combines with PVD AlTiN coating, it has oustanding wearing resistance. Suitable for steel and cast iron slight milling. ● ●

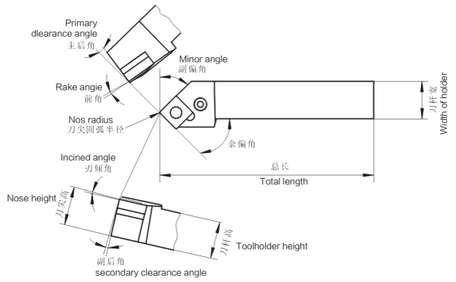
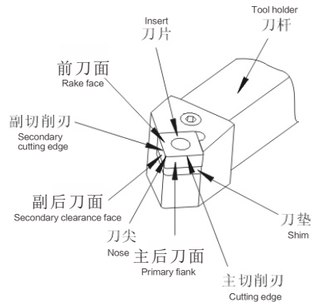
Tool Wear and Solution

Tool Wear Types	Situation	Reason	Solutions
Flank Wear	Higher cutting resistance Notch wear on flank Poor roughness of surface or deterioration of accuracy. 	Soft grades Excessive cutting speed Small flank angle Low feed	Select a higher wear-resistant grade Reduce cutting speed Increase flank angle Increase feed
Crater Wear	Uncontrolled chip Poor surface quality when finishing High speed processing carbon steel 	Soft grades Excessive cutting speed Excessive feed The strength of chip breaker Insufficiet	Change to a higher wear-resistant grade Reduce cutting speed Reduce feed Select a higher strength chip breaker
Chipping	Sudden fracture of cutting edge (rake face and flank) Instability insert life 	Toughness insufficient Excessive feed rate Strength of cutting edge insufficient Instability of the tool	Select a tougher grade Decrease feed rate Increase honing of cutting edge (chamfering to rounding) Increase the stability and setting angle
Insert Fracture	Cutting resistance increased Poor surface roughness 	Toughness insufficient Excessive feed rate Strength of cutting edge insufficient Instability of the tool	Select a tougher grade Decrease feed rate Increase honing of cutting edge (chamfering to rounding) Increase the stability and setting angle
Plastic Deformation	Variation of dimension Nose wear,cutting edge drape or passivating, when processing alloy steel Poor surface roughness 	Soft grade Excessive cutting speed Excessive cutting depth and feed rate Overheat on cutting edge	Select a higher red hardness cutting material Decrease cutting speed Decrease cutting depth and feed rate Select a higher thermal conductivity cutting material(CVD+sufficient coolant)
Build-Up-Edge	Workpiece dissolve with Cutting edge Poor surface roughness when finishing Cutting resistance increased Cutting soft materials 	Cutting speed too low Cutting edge obtuse Unsuitable tool material	Increase cutting speed Increase rake angle Select small sticking force
Themal Crack	Crack by heat cycle (often happen in milling and interrupted cutting) 	Toughness of tool grade insufficient Swell and shrink by cutting heat(cold-thermocyling)	Cutting without coolant/Sufficient coolant Select a tougher and more thermal shock resistance grade
Flaking	Often in instability cutting and cutting high-hardness materials 	Build-up edge Uncontrolled chip	Increase rake angle Increase chip breaker
Notch Wear	Notch partial failure Partial chipping Partial cratering 	Processing hardened material, oxide-scale,superalloy	Select a higher wear-resistance CVD grade Adopt taper cutting (variable cutting depth) Decrease setting angle

The Names of Each Part of Turning Tool

Names of Turning Holder Parts





Effects of Rake Angle

Larger rake angle makes cutting edge sharper. reduces resistant forces of chip flow. diminishes friction and prevent deformation. leading to smaller. less abrasion and higher surface quality. However,too large rake angle would reduce the rigidity and strength of tool.Heat can’ t be diffused easily,Serious breakage and abrasion on tool would occur,reducing too life.Please choose rake angle according to machining conditions.

Value selection	Situations
Small rake angle	When machining brittle and hard materials; When roughing and interrupted cutting
Big rake angle	When machining Plastic or soft materials; When finishing;

The Names of Each Part of Turning Tool

Effects of Clearance Angle

The main function of clearance angle to reduce the friction between the clearance face of tool and the surface of workpiece. When the rake angle is fixed,larger clearance angle can increase and the achieve higher surface quality.However,if clearance angle is too large,the strength of cutting edge would decrease.Also,heat can’ t be diffused easily and serious abrious would occur,reducing tool life.
The principle of choosing clearance angle:Choose small cleara−nce angle if friction is not serious

Value selection	Situations
Small clearance angle	In order to increase nose strength when roughing When machining brittle and hard materials
Large clearance angle	In order to reduce friction when finishing When machining materials easy to be hardened;

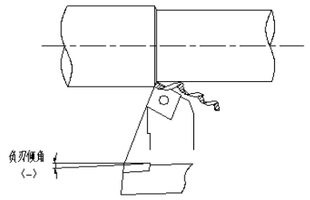
The Names of Each Part of Turning Tool

Effects of Inclined Angle

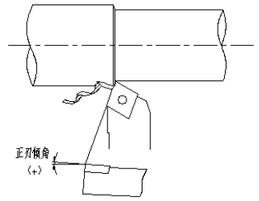
Positive or negative inclined angle determines the direction of chip flow, and also affects the strength and impact resistance of insert nose.

As diagram(1)shows, when the inclined angle is negative, namely nose is in the lowest point as apposed to eht bottom of tool, chips flow to the machined surface of workpiece.

As diagram(2)shows, when inclined angle is positive.namely the nose is in the highest point as apposed to the bottom of the tool,chips flow to the areas of workpiece surface that haven't been machined.



Negative inclined angle



Positive inclined angle

The change of inclined angle also affects insert nose strength and impact resistance.When the inclined angle is negative.the nose is in the lowest point of cutting edge.When the cutting edge enters the workpiece,the contacting point is on the cutting edge or rake face,proteting the nose from impact and increase the strength of the nose.Normally,negative inclined angle should be chosen for tools with big rake angle.This can not only increase nose strength.But also prevent the impact of entry.

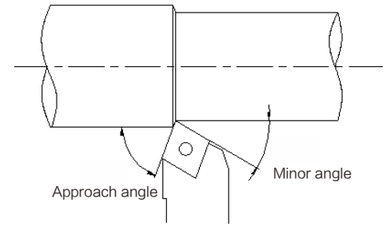
The Names of Each Part of Turning Tool

Effects of Approach Angle

Reduces approaching angle increases the strength of tools and enable heat to diffuse easily,improving surface quality.This is becauce when the approach angle is small,cutting edge width is large,and then the unit width of cutting edge bears less cutting force.Meanwhile, tool life can be improved.

Normally, select 90° approach angle for turning of slender and step shaft; select 45° approach angle for external turning. End surface machining and chamfering.When approach angle is larger,radial force is reduced,cutting is stable ,cutting thickness is increased,and chip breaking is excellent.

Value selection	Situations
Small approach	For those materials with high intensity,high hardness and hardened layer on the surface
Big approach angle	When rigidity of the machine is not enough



The Names of Each Part of Turning Tool

Effects of Minor Angle

Minor angle is the main angle that can affect surface quality,and it can also affect tool strength.If the approach angle is too small, the friction between the secondary flank and machined surface of workpiece will increase,causing vibration.

The principle of selecting minor angle:Select small minor angle when roughing or when the friction is unaffected and is on vibration.Select large minor angle when finishing.

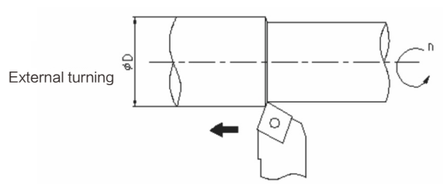
Nose Radius

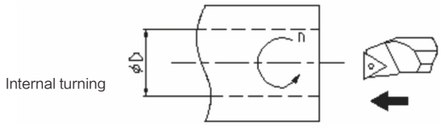
Nose radius significantly affects nose strength and surface quality. Large nose radius means higher cutting edge strength,and the abrasion on the rake face and clearance face can be reduced to some extent. However,if the nose radius is too large,radial force will increase,and vibration is easy to occur,affecting machining precision and surface quality.

Value selection	Situations
Small nose radius	Finishing at small cutting depth Machining parts such as slender shaft When the rigidity of the machine is not enough
Large nose radius	When roughing/When machining hard materials(intermittent cutting) When the rigidity of the machine is not enough

Tool Wear and Solution

Calculation of Cutting Speed



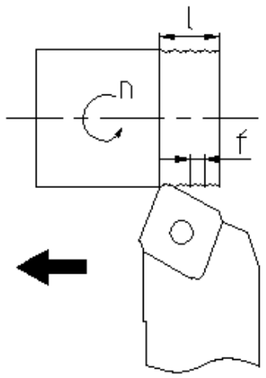


$$Vc = \frac{\pi \times D \times n}{1000} (m/\min)$$

In the formula：Vc： Cutting speed(m/min)
n：Rotating speed of main axle (rev/min)
D：Diameter of workpiece(mm)
For example：When the rotating speed is 280rev/min and the diameter of workpiece is 150mm,the cutting speed should be：

$$Vc = \frac{\pi \times D \times n}{1000} = \frac{3.14 \times 150 \times 280}{1000} = 132(\text{m/min})$$

Calculation of Feed Rate

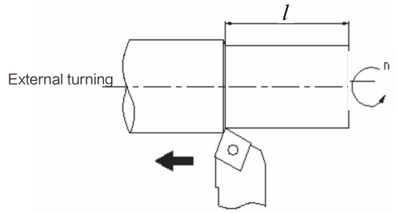


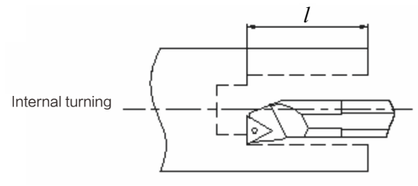
$$f = \frac{l}{n} (mm/rev)$$

In the formula：f：Feed rate per rotation(mm/rev)
L：Cutting length per minute(mm/min)
N：Rotating speed of main axle(rev/min)
For example：When the rotating speed of main axle is 500rev/min, and the cutting length per minute is 100mm/min,the feed rate per rotating should be：

$$f = \frac{l}{n} = \frac{100}{500} = 0.2(mm/rev)$$

Cutting Time Calculation of External and Internal Turning



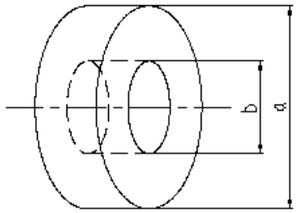


$$T = \frac{l}{f \times n}(\min)$$

In the formula：T：Cutting time(min)
L：length of machined areas(mm)
F：Feed rate(mm/rev)
N：Rotating speed of main axle(rev/min)
For example：When the rotating speed of main axle is 250rev/min, and the feed rate is 2.0mm/rev.the time needed for a cutting length of 150mm should be：

$$T = \frac{l}{f \times n} = \frac{150}{0.2 \times 250} = 3(\min)$$

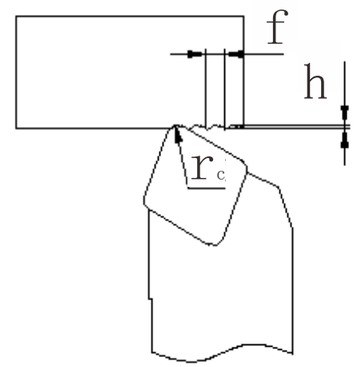
Time Calculation End Surface Turning (Constant Linear Speed)



$$T = \frac{\pi \times (a^2 - b^2)}{4000 \times Vc \times f}(\min)$$

In the formula：T：Cutting time(min)
Vc：length of machined areas(mm)
F:Cutting spead
For end surface without hole, b=0, the formula is still Valid.

The Oretical Value Calculation of Machined Surface Roughness



$$R = \frac{f^2}{8r_c} \times 1000(\mu m)$$

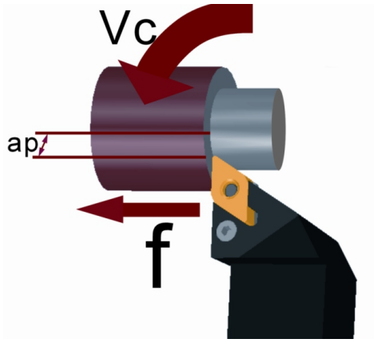
In the formula：R：Theoretical roughness value of machined surface
F：Feed rate(mm/rev)
Rc：Nose radius(mm)
For example：When the feed rate is 0.2mm/rev,and the nose radius is 0.4mm. the theoretical roughness value of machined surface should be：

$$R = \frac{f^2}{8r_c} \times 1000 = \frac{0.2^2}{8 \times 0.4} \times 1000 = 12.5(\mu m)$$

Tool Wear and Solution

Effects of Three Main Parameters

Normally,short machining time,long tool life and high machining precision are expected in machining,so the material quality,hardness,and shape of the workpiece,and properties of machine should be fully considered and then we can select suitable tools and adopt high-efficiency cutting parameters,namely three parameters.



Cutting Speed（Vc）

When the workpiece is rotating on the machine,the number of is rotation per minute is defined as Rotating speed of main axle(n).Because of its rotation,the cutting speed measured on the contacting point of diameter is defined as linear speed.m/min.Normally,linear,linear speed is considered to measure the effect of cutting speed on machining

Effect of Cutting Speed

Cutting speed has significant effect in tool life.When the cutting speed is increased,cutting temperature will increase and tool life will be shortened.Cutting speed varies according to the different types and hardness of work-piece.The below congclusions are reached after many cutting experiments:

(1)Normally tool life would be reduced to half when the cutting speed is increased by 20%. Tool life would be 20% of the original life if the cutting speed is raised by 50%。

(2)Low speed（20-40m/min）cutting could easily cause vibration and shorten tool life.

Tool Wear and Solution

Feed Rate(fn)

Feed rate is defined as the moving distance of tool after workpiece rotates for one circle,measured by mm/rotation.

Feed Rate(fn)

Feed rate is a key factor that determines surface quality. Meanwhtile it also affect the range of chip forming and the thickness of chips during machining.

In term of the effect on tool life,small feed rate leads to serious abrasion on clearance face,reducing tool life.

Cutting Depth(ap)

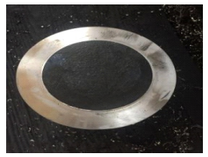
Cutting depth is defined as the difference between machined surface and unmachined surface.Measured by mm.it is half the difference value between the original diameter and machined diameter.

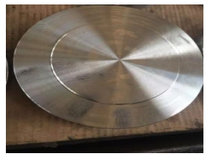
Effect of Cutting Depth

Cutting depth should be determined by the machining alllowance and shape of workpiece,power and rigidity of machice, and tool rigidity.

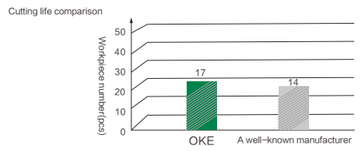
The change of cutting depth has little effect on tool life.If the cutting depth is too low. The cutting nose only scrapes the hardened layer on the workpiece surface.reducing tool life.When there is hardened oxide layer on workpiece surface,higher cutting depth should be adopted within the possible range of machine’s power to avoid cutting nosr just cutting the hardened layer of workpiece.

Stainless Steel Cutting Application Cases





Cutting life comparison



Stainless steel flange

Customer:	XX Company
Workpiece:	Stainless steel flange(no hole)
Workpiece material:	304L
Lathe type:	CSK50A
OKE insert:	CNMG120412-MF/OP1215
Compare insert:	A well-known manufacturer
Cooling type:	Fluid cooling
Processing content:	End face rough turning
Cutting parameter:	Vc= 180 m/min，Fn= 0.28 mm/r，Ap= 2.2 mm

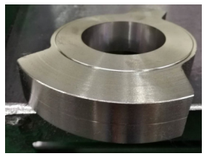
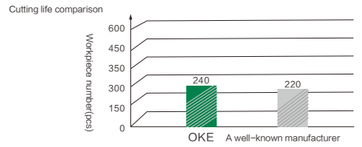
OKE insert:	TNMG220416-GH/OC3215
Compare insert:	A well-known manufacturer
Cooling type:	No
Processing content:	End face semi-finishing turning
Cutting parameter:	Vc= 706 m/min， Fn= 0.32 mm/r，Ap= 1.0 mm

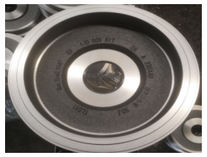
Cast iron Cutting Application Cases

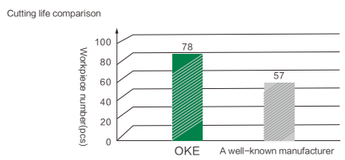




Cast iron

Customer:	XX Company
Workpiece:	Air compressor flange
Workpiece material:	HT250
Lathe type:	Horizontal CNC lathe
OKE insert:	WNMG080412/OC3215
Compare insert:	A well-known manufacturer
Cooling type:	No
Processing content:	External and end face turning
Cutting parameter:	Vc= 356 m/min， Fn= 0.28 mm/r，Ap= 1 mm

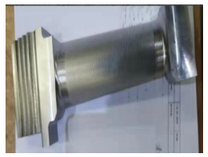


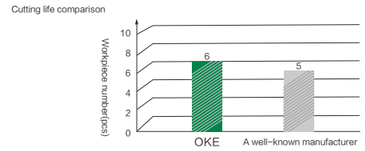


Cast iron

Customer:	XX Company
Workpiece:	Brake drum
Workpiece material:	HT250
Lathe type:	Horizontal CNC lathe
OKE insert:	WNMG080408/OC3215
Compare insert:	A well-known manufacturer
Cooling type:	No
Processing content:	Endface and external rough turning
Cutting parameter:	Vc= 230-290 m/min， Fn= 0.3-0.45 mm/r，Ap= 2-3 mm

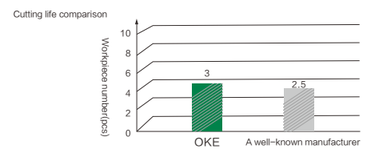
Milling Application Cases





Milling

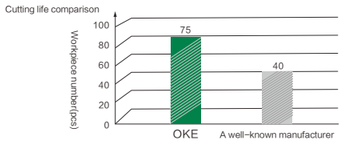
Customer:	XX Company
Workpiece:	Trubine blade
Workpiece material:	22Cr12NiWMoV-5
Lathe type:	HSTM-500-HD
OKE insert:	APKT170516R-QG/OP1312
Compare insert:	A well-known manufacturer
Cooling type:	Fluid cooling
Processing content:	Profile Milling
Cutting parameter:	Vc= 241 m/min， Vf= 3500 mm/min，Ap= 1.2 mm，Ae= 16 mm



Milling

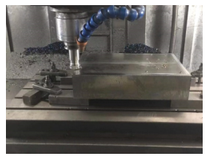
Customer:	XX Company
Workpiece:	Gimbal Joint
Workpiece material:	30CrMnSiNi2A
Lathe type:	VI850
OKE insert:	APMT1135PDER-M2/OP1130
Compare insert:	A well-known manufacturer
Cooling type:	Fluid cooling
Processing content:	Finishing face milling and profile milling
Cutting parameter:	Vc= 120 m/min，Vf= 3500 mm/min，Ap= 0.18 mm，Ae= 2 mm

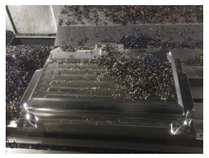
Milling Application Cases

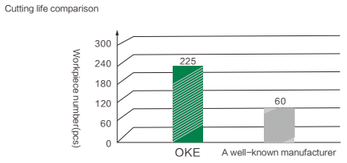


Milling

Customer:	XX Company
Workpiece:	Side panel mold
Workpiece material:	45#
Lathe type:	CNC gantry milling
OKE insert:	APMT1604PDER-H2L/OP1215
Compare insert:	A well-known manufacturer
Cooling type:	Comressed air
Processing content:	U-groove, square groove machining, parting
Cutting parameter:	Vc= 94 m/min， Fn= 1.04 mm/r，Ap= 0.3-0.35 mm



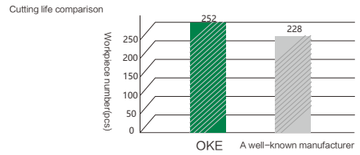




Milling

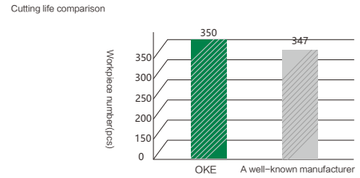
Customer:	XX Company
Workpiece:	Side panel mold
Workpiece material:	45#
Lathe type:	CNC gantry milling
OKE insert:	RPMT1204MO-JSL/OP1315
Compare insert:	A well-known manufacturer
Cooling type:	Comressed air
Processing content:	U-groove, square groove machining, parting
Cutting parameter:	Vc= 138 m/min， Fn= 0.96 mm/r，Ap= 0.45 mm

Threading Application Cases



Thread

Customer:	XX Company
Workpiece:	Joint
Processing industry:	Valve
Workpiece material:	SUS201
Lathe type:	Wenzhou Eastsea CNC
OKE insert:	RT1601L-11WA/OP1205
Compare insert:	A well-known manufacturer
Processing content:	Internal threading turning
criterion of changing tool:	Insert wear
Cutting fluid:	Yes
Cutting parameter:	Vc=75-83m/min Fn=2.309mm/r



Thread

Customer:	XX Company
Workpiece:	Elbow
Machining Industry:	Valve
Workpiece material:	304
Lathe type:	KND
OKE insert:	RT1601L-14WA/OP1205
Compare insert:	A well-known manufacturer
Processing content:	Internal threading turning
criterion of changing tool:	Insert wear
Cutting fluid:	Yes
Cutting parameter:	Vc=58～65m/min Fn=1.814mm/r

E-5 Technical Information

General Technical Reference

Selection Method of Cutting Tool

Selection Method of General Turning Tools:

1.Understand the processed material condition,Machine Model and condition.
2.Select the suitable insert shape,setting angle and clamoin designation.
3.According to above conditions select details of tools as L/R,demension,etc.
4.Select the type,chip break and grade of insert according to all conditions.

Selection Method of Parting and Grooving tools:

1.Understand the processed material condition,Machine Model and condition.
2.Select the insert type according to processing methods(external,internal,face grooving)
3.According to above conditions select details of tools as L/R， demensions,etc.
4.Select the type,clamping designation,chip break and grade of insert according to all conditions

Selection Method of Threading Tools:

1.Understand the processed material condition,Machine Model and condition.
2.Select the tool type according to thread's type,processing methods,etc.
3.According to above conditions select details of cutting tools as L/R,demension,etc.
4.Select the type,chip break and grade of Insert according to all condition

Selection Method of Cutting Tool

Selection Method of Milling Tool Specifications:

1. The first step is to understand the material condition, machine type and state you need to process.
2. Determine the basic type of milling tool according to the processing method(plane milling, Square shoulder milling, imitation milling, milling slot, corner milling, etc.).
3. According to the machining precision and the shape and size of the machining surface and other factors to determine the use of the overall milling cutter or transposable milling cutter.
4. According to the above factors and your machine model to determine the interface, dimensions and other details of the tool.
5. Finally determine the blade specification, groove type, and brand number corresponding to the above factors.

Selection Method for Hole Processing Tool Specifications:

1. Understand the material condition, machine type and state you need to process.
2. Determine the basic types of hole cutting tools(drilling, boring, hinge, thread processing, etc.) according to the processing process.
3. According to the machining accuracy and the dimension of the machining hole, it is determined that the whole tool or the fork-turning tool is used.
4. According to the above factors and your machine model to determine the interface, dimensions and other details of the tool.
5. Finally determine the insert specification, groove type, and brand number corresponding to the above factors.

The Correction Coefficient Table Of Hardness and Cutting Speed

Material		Theoretical Hardness	The Correction Coefficient Table Of Hardness and Cutting Speed								
			Hardness Decrease ← Hardness Difference(Measured Difference − Theoretical Difference) → Hardness Increase								
			−60	−40	−20	0	20	40	60	80	100

Actual Processing Speed=Recommended Processing Speed*Correction Factor Of Cutting Speed

Recommended Cutting Parameters See Packaging

i.e. Cutting general alloy steel, hardness HB180, CNMG120404-OPF/OC2015, the recommended cutting speed is V=250m/min. When measured hardness is HB220, the hardness difference is 40(220−180). Find The corresponding speed correction coefficient is 0.84 on above table, and then the actual processing speed Vc=250*0.84=210mm/min

The Correction Coefficient Table Of Insert Life and Cutting Speed

Insert Material \ Insert Life	The Correction Coefficient Table Of Insert Life and Cutting Speed					
	10	15	30	45	60	90

OP2202	1.20	1.00	0.84	0.70	0.63	0.59

Actual Processing Speed=Recommended Processing Speed*Correction Factor Of Cutting Speed

i.e. Cutting general alloy steel, CNMG120404-OPF/OC2015, the recommended cutting speed is V=250m/min (the standard life is 15 min). If the insert life of 60 mins is expected, find the speed correction coefficient is 0.67 on above table, and then the actual processing speed is Vc=250*0.67=167.5m/min.
